

COPPER BRAZING PASTES

Copper brazing pastes are homogeneous mixtures obtained from filler material in powder, flux and binder, chosen according to base materials to be joined and oven atmosphere.

They are perfectly suitable for **low carbon steel** and **stainless steel**.

APPLICATIONS

Brazing with copper pastes usually takes place in static, vacuum or continuous **furnaces** with controlled atmosphere (protective or reducing). It is well-suited for **series production**, for a great number of standardized joints.

Fields that use more this brazing process are automotive, refrigeration and heating systems, electrical industries.

ADVANTAGES

Compared to traditional methods with solid alloys (rings and other preforms from wires and strips) in furnace, copper pastes permit **higher productivity** and a **good saving of costs**.

However, they also require a particular attention to operating procedures.

OUR OFFER

Our offer includes **high quality copper brazing pastes**, but it is not limited to products: in fact, **we provide technical and prompt assistance** in suggesting the most suitable alloys and the right operating processes for your specific needs.

Are you interested in copper brazing pastes or would you like to receive more information about products and applications?
